                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Searched:
            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DB

specific homeobox genes.";
Cell 79:779-790(1994).

-I FUNCTION: POTENT DORSALIZING FACTOR. HAS POTENT AXIS-FORMING
ACTIVITIES INCLUDING THE ABILLTY TO RECRUIT NEIGHBORING CELLS INTO
SECONDARY AXES, REGULATES CELL-CELL INTERACTIONS IN THE ORGANIZING
CENTERS OF HEAD, TRUNK AND TAIL DEVELOPMENT.

-I SUBSCLIDLAR LOCATION: Secreted.
-I- TISSUE SPECIFICITY: PRECORDAL PLATE, NOTOCHORD, CHORDONEURAL
HINGE; EXPRESSION CLOSELY FOLLOWS THE AREAS OF THE EMBRYO THAT
EXPRESS GOOSECOLD AND XNOT2.

Later on its expression becomes restricted to discrete regions of the central nervous system and to derivate neural crest cells.

SIMILARITY: Contains 3 VWFC domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: Seems to antagonize the function of BMP-4 it and preventing its iteraction with receptors (By SUBCELLULAR LOCATION: Secreted (Potential) ALTERNATIVE PRODUCTS:

cell-to-matrix interactions. Can bind to fibrinogen, tib;
laminin, type V collagen and integrins alpha-V/beta-1, a.
V/beta-3 and alpha-IIb/beta-3.

-!- SUBUNIT: Homotrimer; disulfide-linked.

-!- SIMILARITY: BELONGS TO THE THROMBOSPONDIN FAMILY.

-!- SIMILARITY: Contains 1 VWFC domains.

-!- SIMILARITY: Contains 3 TSP type-1 domains.

-!- SIMILARITY: Contains 7 TSP type-3 domains.

-!- SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.

Med. Genet. 35:846-848(1998).

J. Med. Genet. 35:846-848(1998).

FUNCTION: TYPE V COLLAGEN IS A MEMBER OF GROUP I COLLAGEN
(FIBRILLAR FORMING COLLAGEN). IT IS A MINOR CONNECTIVE TISSUE
COMPONENT OR NEARLY UBFOUTOUS DISTRIBUTION. TYPE V COLLAGEN BINDS
TO DNA, HEPARAN SULFATE, THROMBOSPONDIN, HEPARIN, AND INSULIN.

SUBUNIT: TRIMERS OF TWO ALPHA 1(V) AND ONE ALPHA 2(V) CHAINS IN
MOST TISSUES AND TRIMERS OF ONE ALPHA 1(V), ONE ALPHA 2(V), AND
ONE ALPHA 3(V) CHAINS IN PLACENTA.

PTM: PROlines at the third position of the tripeptide repeating
unit (G-X-Y) are hydroxylated in some or all of the chains.

LOUSAS are a cause of Ehlers-Danlos syndrome
type I (EDS-I) [MIM:130000]; also known as Ehlers-Danlos syndrome
type I (EDS-I) is an autosomal dominant connective-tissue disorder
characterized by loose-jointedness and fragile, velvety,
stretchable, bruisable skin that heals with peculiar 'cigarette-
paper' scars. Inheritance is autosomal dominant.

-! DISEASE: Defects in COLSA2 are a cause of Ehlers-Danlos syndrome
type II (EDS-II) [MIM:130010]; also known as Ehlers-Danlos syndrome
syndrome mitis. Inheritance is autosomal dominant.

-! SIMILARITY: Contains 1 VWFC domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "A single

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
